

Concept Paper

Academic Year:	2020/ 21
Name of the Undergraduate:	P.K.D Sewmini
Index No:	AF/20/16848
Code and Title of the Course Unit:	
Date to be submitted:	Within the first week of the first semester of the final year

Instructions:

This concept paper is meant to take an idea of the field of interest of your independent study in order to avail necessary guidelines to develop your independent study proposal in the final year. It should be no more than 2 pages.

Title of the Proposed Study: Hotel Operations Manager
Human Computer Interaction, Mobile application development, Designing (figma)
Introduction/Background of the Study: <i>(Why does this study need to be conducted?)</i> Efficient internal management is critical in the hospitality industry, where complex operations must be seamlessly coordinated to maintain high service standards. Many hotels currently rely on outdated or fragmented systems for managing kitchen operations, staff schedules, and stakeholder interactions, leading to inefficiencies and communication breakdowns that impact overall performance. This study aims to address these challenges by developing a user-friendly UI/UX application tailored for hotel management. By integrating various internal processes into a single platform, the application will streamline operations, enhance communication, and improve task management. This approach promises to boost efficiency, reduce operational costs, and enhance guest satisfaction, making it a valuable contribution to modern hotel management practices.

The Research Problem/Problem of the Study:

Hotels face significant challenges in managing their internal activities due to the reliance on outdated and fragmented systems. These inefficiencies often result in disjointed communication between staff members and stakeholders, delays in task completion, and increased operational costs. The lack of an integrated solution for managing kitchen operations, staff schedules, and other internal processes exacerbates these issues, leading to decreased overall effectiveness and potentially affecting guest satisfaction.

This study addresses the problem of inadequate internal management systems in hotels by proposing the development of a comprehensive UI/UX application. The application aims to integrate various operational functions into a single, user-friendly platform, thereby improving coordination, reducing inefficiencies, and enhancing the overall management of hotel operations. The goal is to

identify how a tailored application can resolve these issues and contribute to more effective internal management practices in the hospitality industry.

Objectives of the Study: *(What does this study wish to achieve?)*

1. **Develop an Integrated Management System:** To create a comprehensive UI/UX application that integrates key internal processes of hotel management, including kitchen operations, staff scheduling, and stakeholder communication, into a single platform.
2. **Enhance Operational Efficiency:** To streamline hotel operations by reducing reliance on fragmented systems, thereby improving task management, communication, and coordination among staff members.
3. **Improve User Experience:** To design an intuitive and user-friendly interface that simplifies interaction with the application, making it easy for staff to manage their tasks and access necessary information efficiently.
4. **Increase Overall Effectiveness:** To assess the impact of the application on operational effectiveness, including reduced operational costs, improved staff productivity, and enhanced guest satisfaction.
5. **Provide Scalable Solutions:** To ensure the application is adaptable to the specific needs of different hotels, providing a scalable solution that can be customized based on individual operational requirements.

Significance of the Study: *(How is this study useful?)*

This study is significant in several ways:

1. **Enhanced Operational Efficiency:** By developing an integrated UI/UX application, the study provides a solution to the fragmented management systems currently used in hotels. This integration will streamline internal processes, reduce inefficiencies, and lower operational costs, thereby improving the overall productivity of hotel operations.
2. **Improved Staff Coordination and Communication:** The application will facilitate better communication and coordination among hotel staff and stakeholders. This will result in smoother daily operations, quicker response times, and more effective management of tasks and resources.
3. **Increased Guest Satisfaction:** By addressing internal inefficiencies, the study aims to indirectly enhance guest experiences. Improved operational efficiency and staff productivity can lead to better service quality, faster response times, and a more pleasant overall experience for hotel guests.
4. **Scalable and Customizable Solutions:** The development of a scalable and customizable application offers value to a wide range of hotels, from small boutique establishments to large hotel chains. This adaptability ensures that the solution can meet the diverse needs of different hotel operations.
5. **Advancement in Hotel Management Practices:** The study contributes to the field of hospitality management by introducing a modern technological approach to internal operations. It serves as a model for future innovations in hotel management systems, encouraging further research and development in this area.

Methodology of the Study *(How would you conduct this study?)*

1. **Requirements Analysis:** Gather detailed requirements from stakeholders (students, faculty, and administrators) through surveys and interviews.
2. **Design Phase:**

Create wireframes and high-fidelity prototypes for the mobile application using tools such as Figma or Adobe XD, with an emphasis on intuitive UI and engaging UX.

3. **Development Phase:** Use frameworks like React Native or Flutter to develop the mobile application, ensuring cross-platform compatibility.

4. **Testing Phase:** Conduct usability testing sessions with potential users to assess the effectiveness and ease of use of the application, followed by iterative improvements.

5. **Deployment and Evaluation:** Deploy the application within a pilot educational institution and gather data on usage, performance, and user satisfaction for further analysis.
